

How `try` works

- 1) Attempt to execute the try clause
- 2a) If no exception occurs, skip the except clause. Done!
- 2b) If an exception occurs, skip the rest of the try clause.
 - 2bi) If the type of the raised exception is a subclass of the named exception type, then execute the except clause.
 - 2bii) Otherwise, propagate the exception to the world.

Unhandled exceptions halt execution
