

```
def read_integer():  
    """Read an integer from the user."""  
    return int(input("Please enter a number: "))
```

# What Might Go Wrong?

```
def read_int():  
    """Read an integer from the user."""  
    return int(input("Please enter a number: "))
```

What happens if the user enters a nonnumeric input?

# Solution
