

try

raise raise

finally

print 'Goodbye, world!'

#Goodbye, world!

#Trackback(most recent 10 last):

#file'<std::in>',line 2,in <module>

#NotImplementedError

The `finally` clause

Executed upon leaving
the `try/except/else` block

```
try:  
    raise NotImplementedError  
finally:  
    print('Goodbye, world!')
```

```
# Goodbye, world!  
# Traceback (most recent call last):  
#   File "<stdin>", line 2, in <module>  
#   NotImplementedError
```

How *finally* works
