

```
def
    """Read an integer from the user (fixed?)."""
    while
        try
            "Please enter a number: "

            break
        except
            print "Oops! Invalid input. Try again..."

    return
```

Solution?

```
def read_int():  
    """Read an integer from the user (fixed?)."""  
    while True:  
        try:  
            x = int(input("Please enter a number: "))  
            break  
        except: "I'll just catch 'em all!"  
            print("Oops! Invalid input. Try again...")  
    return x
```

Oops! Now we can't CTRL+C to escape
