

```
print(*objects, sep=' ', end='\n', file=..., flush=False)
```

Variadic Positional Arguments

A parameter of form ***args** captures excess positional args

These excess arguments are bundled into an **args** tuple

Why?

Call functions with any number of positional arguments

Capture all arguments to forward to another handler

Used in subclasses, proxies, and decorators

```
print(*objects, sep=' ', end='\n', file=..., flush=False)
```

Variadic Positional Arguments
