

try

raise "TODD"

except except

prints 'Looks like an exception to me!'

#Lookstolikeanexpertto me!

#Trackback(most recent 10 last):

#file'<std::in>',line 2,in <module>

#NotImplementedError: Too

raise within except clause

```
try:
```

```
    raise NotImplementedError("TODO")
```

```
except NotImplementedError:
```

```
    print('Looks like an exception to me!')
```

```
    raise
```

Re-raises the currently active exception

```
# Looks like an exception to me!
```

```
# Traceback (most recent call last):
```

```
#   File "<stdin>", line 2, in <module>
```

```
# NotImplementedError: TODO
```

Used to acknowledge an exception
but also propagate to external handlers

Good Python: Using `else`
