```python
# How should we check for an empty list?
data = []
if data:
    process(data)
else:
    print("There's no data!")
```

Checking for Truthiness

```python
# How should we check for an empty list?
data = []
if data:
    process(data)
else:
    print("There's no data!")
```

You should almost never test
`if expr == True`

Loops
